ABSTRACT

A circularly polarizing plate of the invention comprises a complex type scattering-dichroic absorbing polarizer including a film that has a structure having a minute domain dispersed in a matrix formed of an optically-transparent water-soluble resin including an iodine based light absorbing material and a quarter wavelength plate formed with one or more retardation plates. The circularly polarizing plate has a high transmittance and a high degree of polarization and in which uneven transmittance can be suppressed when black is displayed.
